

Home - Knowledge

The Knowledge space consolidates the output of research on components of the Southern Ocean ecosystem.

The space is used as an information base to support future and current projects, theoretical developments and policy initiatives.

It does this through summaries of data, published and unpublished information, and interrogation of Antarctic datasets available online.

All material within this space includes citation of published information, web links and directives to further information where applicable.

It's current structure reflects previous and existing bodies of work that have been undertaken within the Australian Antarctic Division, and will develop further as new projects are included.
